

Detecting the Invisible Planets of our own Solar System

Larry E. Johnson,* 151 DuPont Ave. N.E., Hector, MN 55342

October 18, 2010

1 Basic concepts of photographing the invisible in other existence-planes

“The superstate activates the etheric, that is, by exciting any molecule to a higher vibratory level with the e.m. field there will be increased vibratory activity with harmonics that extend into the etheric. So the higher energy electron falls a greater orbital distance while maintaining its program on the molecule, so that for instance H_2 , or any solar wind molecule, possesses temporary bonds that form and break with extremely high rates in the superstate. This is similar to gas laser operation, such as the carbon dioxide or nitrogen laser, where an electrostatic field is used to excite the gas into a resonance, usually in the MHz range of a phonon (like 24 MHz for an N_2 laser), creating coherence stability in the gas so that the energy can organize and emit uniformly over a very narrow band width in this activating of the etheric. But a wide band superstate creates a certain field which has information in it which imposes on whatever is in the vicinity like the human body, the growth of a crystal, or even an entire planetary body. It is given coherence by a magnetic field and forms essentially in the manner of a hologram. For instance, the closer you get to the Sun, the more solar wind molecules are in the superstate, making it possible to photograph the etheric bodies that extend outside of fully-suited astronauts and outside of entire planets. This can be done on ordinary photographic film, similar to motion picture film, as it is exposed at a selected rate for a certain rate of change. The etheric, of course, changes with a person’s thoughts, emotions and so on and it can actually be photographed once their atmosphere is super-activated. This photographing must occur with a genuine photographic plate system, as it will not digitally encode. That is, it cannot be transferred through an analog digital converter, as in a video tape, as this information is lost. [So in particular space telescopes like the Hubble, or space probes, would not detect these etheric bodies, unless fitted with Ag-compound photographic film.] Also, there need not be a great deal of light, as actually the etheric creates its own light known as color which will then impose upon the photograph, giving the illusion of illumination. It uses an emission within the etheric from the physical body to take the photograph. This is a biophoton, however the transfer mechanism is non-quantum. It has been theorized that this is a phenomenon where two photons may emit without interconnecting light. This is essentially the theory of the etheric where a biophoton from a cell can emit and then cohere another photon emission onto a photographic plate or into any other exterior object. This is the means through which people can transfer psychic impressions and even certain energies, as healing energies. This transfers a photon, but the information is a two photon effect in and out of space without light. This is perceived in the mind’s eye as color. It cannot be photographed as color, but there are shadows and shades of this which can be photographed, as if you are observing a series of layers in a hologram.” [1]

2 Applying this to invisible planets like Vulcan and Etheric-Mercury, and even to finding a new planet near Saturn

Since photographing the etheric body makes use of the ultra weak photons generated by the etheric body, in the case of Venus especially this might be the explanation of some reports of an Ashen light for Venus. For Mercury, the use of photographic plates by earlier astronomers who were photographing Mercury transits of the Sun's face, produced many surprising detections of enormous Mercury Aureoles, see Fig. 1, which seem possibly at least partly due to Mercury's

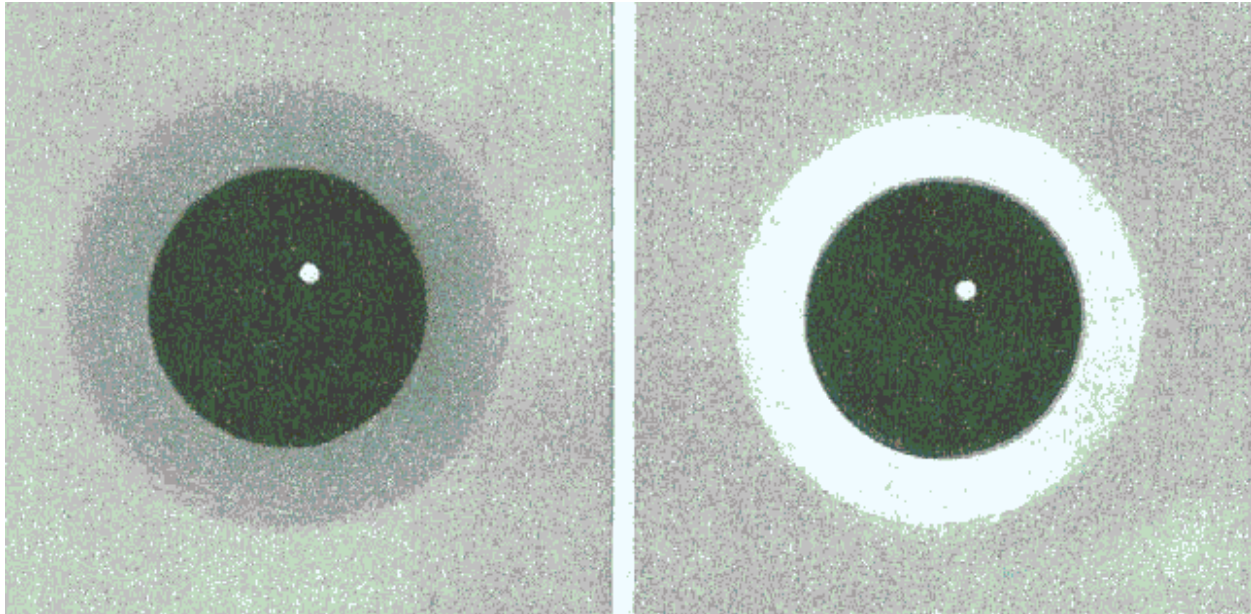

Figure 1: Early high-power photographic work with Mercury transits across the sun's face led some astronomers to wonder if this planet had an enormous atmosphere! The bright spot is possibly also part of Mercury's etheric or 4D body since it is not in digital camera photos.

etheric body, i.e. Etheric-Mercury. The fact that this shows up against the Sun's powerful lighted background may attest partly to the Ag-compound's great sensitivity to the ultra weak photons whose emission is triggered by the superstate. But thus far the Aureoles' explanation has been credited only as "probably a telescopic optical effect" [2]. Keith's rare book, Worlds Beyond [3], makes the very surprising statements that when astronomers point their telescopes in the right direction they will see not only the mythical inter-Mercurial planet Vulcan (page 39), but also a previously invisible companion of Saturn (page 36) and one of the Earth (page 35). So we feel certain that he didn't mean that digital cameras or the human eye were being used for this, but only Ag-compound photographic film or plates - even or especially with space telescopes like the Hubble, and possibly with molecular-spiral enhanced Ag-compound film that is made more sensitive to the etheric's ultra-weak photons!

"It is possible to photograph the etheric or 4D as we call it, and the superstate of the molecule is one way of approaching this as an activation mechanism which does not make it necessary to know everything about the superstate or primary-field-balanced matter in detail. It is only necessary to program or activate it by subjecting it to certain fields. The interpretation is always made from the standpoint of the individual researcher as to whether he can know 4D from knowing 3D. The only phenomenon in 3D that can reach 4D is that of imaging and photography because the ultra weak photon effect is the only effect that moves between dimensions and there is not nearly sufficient

energy in 4D to activate a device electronically at this stage of technological development. So your laboratory will need to move vastly beyond where it is now in order to move into detecting 4D using photography. The reason the superstate activates 4D is because it creates radicals which move in an atmospheric wind and begin to change their form at rapid rates so that they interact differently. It is the change in the molecular field, e.g. the change from an NO molecule to an N₂O, or to an NO₂, or to an N₂O₂, or the same with sulfur or carbon, or the many other changes which creates the increased information flow from 4D's superspace dimensions of the neutrinos. So when a molecule changes, it has different physical properties, different melting point, different boiling point, different vapor point, and different energy of formation. These are all information properties of the new molecules, creating an information state which releases very ultra weak photons that can create images. The most common at this time would be photographic plates with ordinary film, but it is also possible to enhance this film with molecular spiraling, or even to apply ultra sensitive or superconducting electronics. But this is not the type of thing where one should try to give instructions to those who do not have sufficient experience or understand the etheric, as it is the spiral field coming off of crystals which facilitates the interaction with 4D. In another contemporary approach this etheric field is applied in conjunction with the temperature that most affects the structuring of water. Unfortunately these are very simple concepts that many of you have not adequately comprehended. The structuring of water is separate entirely from the temperature of the chemical reactions, and so it will be necessary to find the optimum temperature at which it functions within the specific material that it is operating upon, whether it is organic or inorganic. Temperature is the characteristic of the force field, but the application needs to move out into more varied and specific areas." (adapted from t.135 of 1/17/96)

But what relationship would these etheric or ghost-like images bear to the actual planets, and how could such higher-energy planets host the great civilizations of human life, right here in our own solar system where we have for many years now assumed that we were physically all alone? The next transcript quote helps to verify what I have now come to see actually contains the true answer: "Voltage is in 3D, but the amperage is in a higher dimension flowing at $\frac{6}{5}c = 360,000$ km/sec, so it moves along the wire faster than the voltage and creates the tunnel that is a reverse effect occurring after the amperage or the plasma has flowed through. It is equivalent to the dark electricity of spiraling back out, as the amperage is white and spirals in. The tunnel is actually the combined electromagnetic oscillated into a force structure, so it is a moving force field within 4D of other-D. Within 3D it appears as amperage or the flow of electrons, but in reality the electron has been transformed into a plasma state wherein it is not the same electron that occurs in the shell system. It is in a conductive or superconductive state, and it begins to move into the $3\frac{1}{2}$ D or 4D. In the shell system it is strictly bound, creating 3D matter. However, form cannot be measured on your side. Only on this side is form seen to be the nature of everything, whereas energy is merely an expression of your dimension. It is principally information and form in our dimension. The reason you pulse the amperage is for the development of a vortexal system, because the tunnels break and collapse into a center as in the manner of a toroid collapsing to its central circle. This creates the gravitational force field. So initially they are a nuclear force field in each atom or each molecule. To create gravity, if it is pulsed, it is then a collapse of primary light energies into a center. The purpose of these tunnels is that they circulate energy to create not only gravity, but also an actual space, an area in space. That is, they relate to the existence of space itself, not to the existence of the fields in space, but the actual space. Tunnels are force fields, and the final effect is that they collapse, which occurs when the system is pulsed. This is related to the phenomenon of the phonon, which is the pulse. I.e., the pulse rate controller is the phonon, which makes a synchronous system. Without this pulse there is no collapse of the field and no development of gravity or the space field within the circumference in which the amperage

is circulating. Now you have the conformal geometry of the circle which when rotated produces the sphere and the many forms that can be contained in the sphere, such as the polyhedra. So the phonon is the controller to this. However the energizer from below and above is voltage and amperage. You say, voltage is moving up, and amperage is moving down. Amperage relates to the tunneling effect of 4D. The energy is the voltage coming up from 3D. The amperage is the flow from the higher dimension and the information. The voltage contains all of the energy from the lower dimension. You can not move energy into 4D, so voltage only energizes the lower dimensions to accelerate an object towards c . Then, there is the movement down from velocities above c down into c . The exchange point is where it occurs in this 360,000 km/sec dimension, where gravity and the force fields develop, the dimensions above this being strictly form and program, the dimensions below c being strictly mass and energy, as the critical juxta positioning of the two that creates gravity, space and time. This so-called substance, made up of anus from which matter is created, mass energy, this substance has a velocity of $c = 300,000\text{km/sec}$ in this dimension - that is, the substance dimension. And there is a substance in that substance dimension that moves all the way up to other parts of the cosmic system. There is substance in the galaxy, and in the solar system, and the planetary system. There is substance in all of them. And in the anu system, neutrinos operate. We have the whole cosmos then. The tunnel, the oscillating system in outer space which you call the cosmic and the constellations and so on, relate to the oscillations of magnetic and electrical energies within the solar system as you see it. Then they jump from this visible system to this higher solar system, this system of resonance, which is broadcast outward on the ionized plasma waves, and the Alfvén waves from the sun which is a lower component of these in the electromagnetic spectrum. However the positions of these higher objects such as the invisible planets, are related to the form aspect of the higher dimensions. So all of these do tie together, even out to a very high level of organization and a great level of distance, as ultimately this distance does not exist in 4D, because space is ultimately annihilated by primary-field-balanced matter. That is, as the amperage field is collapsed, the space is literally consumed by the material, so the material can move through the space, virtually any space, at virtually unlimited velocity, which begins at gravity's or amperage's 360,000 km/s or $\frac{1}{12}$ higher than this at the thought or mind field's velocity of 390,000 km/s and goes upward. These are only barriers (like the sound-barrier), not human-intellect limitations." (adapted from t.71 of 7/15/93)

Next, we try to include more of the plasma point-of-view or insight, and what the forms of life in these more etheric planets might be like. For example, might the soon-to-be-discovered planet near Saturn actually be like this, i.e. a subtle plasma-structure near Saturn that must be classed as a separate planet because it operates independently after formation, and that could host equally subtle life forms with human-level consciousness? When the sun is overhead of a spot on Saturn that is about as close as it could get to observers on Earth (i.e. Saturn opposite Sun, or Saturn and Earth in conjunction), because the frozen gases in this large spot have become plastic under the sun's rays and many particles, including plasma particles, have been ejected into space around Saturn, it seems possible that such an independent higher-dimensional planet that is not a satellite of Saturn could be formed: "Saturn ... revolves so slowly that one side is plastic and the other side is frigid, so there is a certain amount of dross thrown off at all times. This may account for the rings that encircle her." [3], page 35. (He also mentions on p.35 an invisible planet near the Earth that can be seen only when the sun is similarly in the meridian position.)

Modern digital-camera photos of Saturn from space probes for example are very high resolution and clear, but invariably do not show the huge, bright spots that were so prominent in the older, Ag-compound photographic plates! This difference, especially between new and old photos of Saturn and Jupiter, is very pronounced as we try to illustrate in the examples shown in the separate file titled, "new-and-old.JPEG". This seemed to be true whether the modern digital

photos were taken from a space probe or from Earth orbit, or for that matter from Earth's surface where the older, Ag-compound plates were used. I.e., the early high-power photographic work with Saturn and Jupiter (especially Saturn) contained lots of huge bright spots that simply do not appear in modern digital camera photographs, so I think that it was the detection of the ultra weak photon image by the Ag-compound film used then that was revealing some trace of the etheric bodies of these huge gaseous planets.

3 Some further transcript quotations, slightly rewritten for our present applications

Our physical reality, or the domain of Maxwell's electromagnetism e.m.-1, is matter that has form particles that relate primarily only to the form-axes $\{\mathbf{a}^1, \mathbf{a}^2, \mathbf{a}^3\}$. "In the astral existence-plane the three form axes $\{\mathbf{a}^3, \mathbf{a}^4, \mathbf{a}^5\}$ predominate and are what identify astral reality, with the electric form axis \mathbf{a}^1 and magnetic form axis \mathbf{a}^2 having only secondary effects. That is, you may influence the astral world with electromagnetic fields, but only very slightly, as it is the etheric or growth axis \mathbf{a}^3 which principally dominates the astral world along with the mental and astral form axes. So it is a question of which reality it is in, that determines what the etheric form-axis \mathbf{a}^3 is doing. Normally it is very difficult for any physical existence-plane process to affect anything very much in the other six planetary existence-planes, but those worlds having two form-axes in common with the physical world receive the greatest physical-world influence, and there are four of these." (adapted from t.16 of 10/19/89)

"Superoxygen or structured oxygen is a spiral-programming system that works through the lung and connects to all of the oxygen molecules in the entire world as a vibratory carrier of information that can connect people; it is the harmonic to the etheric field and the fields that are strictly in 4D carrying no matter but only vibratory activity. These can be carried upon oxygen molecules that are in a chain structure, similar to structured water, except that it is pure oxygen, O raised to some octave power. So there are chains of perhaps 4, 8, or 16, or 3, 6, and 12, oxygen molecules. These relate to the various number systems such as the $1\frac{1}{2}$ relating to 3; $2\frac{1}{2}$ relating to 5, 10; $3\frac{1}{2}$ relating to 7, 14, and so on. The exact number of spiral-codes on the oxygen chain relates to a similar function of the neutrino. So oxygen is the basic means of energizing the etheric system and this is why in the Eastern and Tibetan ritual there were always breathing exercises that increases the spiral-codes on the oxygen and the extent of the superoxygen chain. In a very short time in the future, as this is being worked on currently, it will be possible to photograph your thought forms by programming the oxygen. This can be done with the simple photographic equipment that exists at this time. It is not complex. The oxygen molecule however must be programmed in a very specific way in a specific pattern by interphasing it with various electrical fields. Eventually the devices will be built that will pump oxygen and will program it and create an environment where the thought form of the etheric body may be photographed normally, or for greater information using a laser and a hologram." (from t.78 of 10/24/94)

"Avoid the aspect of the infrared photon, which is a product of the molecular vibration. Ours is not heat vibrations but the internal electron-proton resonance which is always occurring because of orbital motion inside the atom. This is the information of the etheric that changes the structuring and emits the photon. It is possible to use this and take actual photos of the interface of the etheric with the physical by using a very narrow band light such as the laser. This could be used to generate a hologram, an example of one of the effects of this field. It's also possible to add an electric field to excite the atmosphere surrounding it and interact with various emissions within the etheric around the body to emit photons which can be picked up and observed. All

of this is related to a large structural component, a grid system or a node system which exists everywhere in space. Its presence is not great within your space, but as you move into the other spaces this very large grid is much more of a factor. There also is the generation in water of the programming and imprinting of energies that are higher than those that can be detected through the e.m. The visible band is so important because it contains the factor of information from the etheric, or from the "life force," as it was called in ancient times. Some of these emissions which are captured on photo emulsion are involved with certain materials which are different than those which are present in the optical center of the eye, particularly we are referring to Ag and silver halides which are capable of absorbing certain frequencies and bands and the UV, particularly the far ultraviolet that are quite different from others that the human optical system, which is based upon the amino acids and hydrocarbons, is capable of detecting. Because of the presence of this UV, these have the greater potential of transferring the information in the form of images from the etheric. Another aspect involves the programming of water, and also the growth of seed crystals. This can be done in a number of ways. The most promising means of assessing and measuring programmability are by measuring the absorption and emission spectra in the UV of the water. This is an indirect measurement and is not directly related to programming phenomenon, but it occurs because there is a structural change in the water, where there is a great hydrogen bonding force and this in turn shifts the UV absorption band. We mention it here because it is related to the phenomenon of the programmability of the UV and to the ultra weak photon, and the emission of these photons during certain events which can then be recorded on photographic film that uses the Ag compounds. The reason for this is somewhat esoteric, but involves generating the superconducting electron pair by two Ag atoms simultaneously. These electrons are then in coherence with one another, and produce coherent light, which is light that is easily registered upon the photographic plate. Others may come up with other explanations, however we believe that it is the pairing of the electrons and the emission of simultaneous coherent radiation with no phase difference that results in the production of these photographs." (adapted from t.192 of 1/16/97)

"There is not a general understanding of other dimensions within the scientific community, although there have been some very advanced scientists, such as Einstein's student Wheeler who postulated and defined the existence of superspace, a valid concept which could eventually lead to understanding psychic phenomena. However it has not developed this way because the scientists have not gone with conceptualizing higher dimensions; they have no concepts or ways to describe higher dimensions within their scientific disciplines and their intellect. They need to understand these dimensions within a mathematical structure. With the suppression or non-belief in superspace, which was brought here deliberately through Einstein and Wheeler, there cannot be any effective understanding of the psychic or 4D, and of the many other terms and subjects which we have brought in here. Instead the scientists have chosen to concentrate upon the anomalous effects or the inadequacies of quantum theory through the Heisenberg uncertainty principle and the uncertainty of measurement which does not lead to a further understanding of physics; it only points up the weakness and limitation of quantum mechanics and quantum theory in general." (from t.97 of 4/28/95)

"The neutrino can be quantitative because it produces superspace, but it may also be purely energetic as it produces mass. Neutrino is another word for the basic structure of superspace, however this structure is altered by the vortexal structure, neutrinos being the flow as these structures pulsate. Neutrino is the basic building block, however its translation into mass and energy occurs through the vortexal structures, which then change the neutrino, which has a polarity based on direction in superspace, into a charge phenomenon within this dimension. There are two types of charges: the magnetic field being a reaction to inward pressure from the higher

dimensions down the center of the vortexes where the magnetic field is the explosion outward of this inward pressure, and the electric field is the spiral of the vortex. However in superspace they are combined into a single stream that is the neutrino. So the neutrino is a parallel stream of electric and magnetic lines contained within a different reality, which does not have polarity, but has direction where the two charges, the out charge and the in charge, are these directions. So out and in charges produce positive and negative charges, or north and south poles. The reason that the vortexal fields are so difficult to detect is because of their non-charge nature. They can not be detected externally, generally, but only through the interaction with other vortexal-program systems (i.e., crystalline systems). You can detect the presence of a vortexal system around the human body by using a crystal, if you are particularly sensitive to this aspect. Equipment will be developed that will detect this, separate from the human system, in the future. It is difficult because of its non-charged nature. As you understand charge, neutrino and anti-neutrino are uncharged, however they have the relativistic effects similar to an electron, but this is based on the main portion of time and space being stable within this dimension, but distorted down linearly with velocity. So the neutrino flow is the essence, but detection will be difficult, relying on crystalline systems which will replicate this phenomenon with a neutrino impressing itself upon other molecular crystalline systems to form images. These images are from outside spacetime, known as the astral images or the images of what is referred to as Akashic, and so on. These are actual realities of very different creation. But with more advanced crystalline systems, such as grid simulation, more capable of communicating directly with the nucleus, this becomes a practical method of imaging.”

“The harmonic characteristic of the vortex allows for slight frequency differences, which is the shift in atomic form, from atomic to molecular to crystalline. I.e. frequency complexity is necessary within one of the two basic cycles, that of energizing, or that of relaxation or force. The terms implosion and explosion are also appropriate to some extent, the universe consisting basically of etheric substance in the form of lines of force that have been pressed to where it explodes into 3D with a portion continuing to implode back through the vortexes into the higher dimensions or the superspace structure of greater than c by a factor of up to one million as this is also the factor of the voltage jump from the outer to the inner electron. So you must consider high voltage as a possibility within your systems. The frequencies relate to the form of the vortex and each vortex has a number of frequency levels. At the vortex entrance is the timing frequency and at the small end the high frequencies. There are numbers of vortexes supporting individual atoms and each vortex relates to a particular frequency series, terminus to either a valence or conduction band. The frequency would be different for a valence band than it would be for a conduction band, but they occur automatically. I.e. if the conduction band is energized, there is relaxation programmatic to the valence band within the particular atomic structure. This is programmatic, so it need not be programmed except within one vortex, and so it is only possible to create a single vortexal structure.” (from t.21 of 1/11/90)

“Superspace theory can not be humanly completed because of needed links between form of higher-D subparticles and molecular frequencies in 3D, but the mind cell working through the human intellect reaches completion and links these, one static and one dynamic. There is always dynamic activity like the heterodyning of frequencies down through the vortexes of superspace, from the conditions at c and beyond c , but the interplay of these occurs only within the particle pair or within the photon. This is spread outward into 3D and ultimately with the reduction of energy to the static crystal, but this guidance of the final process of the particle positioning is necessarily from the biofield and the mind cell, which want to form a certain type of crystal, and this would not occur if the mind cell were limited to mathematics, because it might instead want to be artistic or holistic. So the impression or image of what is to be completed is a part of

the completion process. This is the actual link between frequency and form and the true nature of Wheeler’s superspace as opposed to any conjectured structure within mathematical physics.” (interpreted from t.27 of 6/20/90)

“There will be a technology involving extreme new types of supermagnets that will be hundreds of times more powerful than existing magnets. They will be a means of generating enormous amounts of electrical power because the magnetic force is a form of programming into the primary-field-balanced form of matter. In this case elements near the ferromagnetic and rare earths are fabricated into the supermagnetic PF-balanced material as this all evolves in the superstate of inert gases and water. These PF-balanced systems are the final end of the superstate which is like a growth medium for the PF-balanced matter. Right now magnetism is only derived from the alignment of the spin of the orbital electron, but this can be enhanced if there is also alignment with the nucleons. This allows some of the magnetism of the nucleus that’s in the form of nuclear force to transduce into the magnetism of the electron, so this leads to a super-superstate too. In fact there are many levels of superstates, each one with a greater degree of organization than the previous and a greater harmonic extent. This will be a difficult technology to evolve, as it is interactive with people and their mind cells which provide a neutrino structure i.e. superspace. Ultimately it is the force field which contains the information which comes into the body through the etheric and the chakra system, and above that is the galactic system that is mental that is reached only through the primary-field balance or final end of the superstates.” (from t.99 of 5/3/95)

Above I have tried to provide the reader with a beginner’s explanation of the superstates more from an information-theory (transference of frequencies) viewpoint in the differential geometry’s dimensional mathematics with the matter+antimatter symmetry, and how this would lead to further types of astrophysical imaging that eventually scientists will consider very valuable experimentally and well worth the extra effort and expense.

My own personal or religious beliefs hold that the huge information engrams or plasma-wave solitons coming slowly through the \approx one $1H^1$ atom per cm^3 plasma in interplanetary space from the Sun, as Alfvén wave solitons, are thought forms that are sent from the higher intelligences of and beyond our Sun, to control effectively all major (e.g. weather, scientific, and political) events on the planets (mainly on the Earth and in the advanced living-places of the nonbreathers). The actual particle that is the “ultimaton” of the *Urantia Book*’s “gradant”, I feel is a bound pair of these basic quanta representing one grid lattice site, and the “ultimatic rays” that the *Urantia Book*, p.474 claims that Earth’s physicists will detect long before they actually discover the ultimaton (i.e. the grid) itself, I feel are these Alfvén plasma wave engrams that are especially of Astrological-like importance that e.g. Max Heindel studied intuitively before 1911, and Alfvén won a Nobel prize for discovering theoretically (at least in the lower consciousness) in 1970.
